

## Ressort horizontal $x = 0$ : longueur à VIDE

### Dynamique cas $x > 0$

$$\vec{F}_R = -k(\ell - \ell_0) \vec{e}_x = \underbrace{-kx \vec{e}_x}_{<0}$$

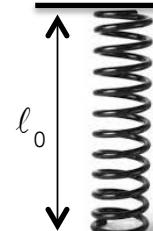

### Dynamique cas $x < 0$

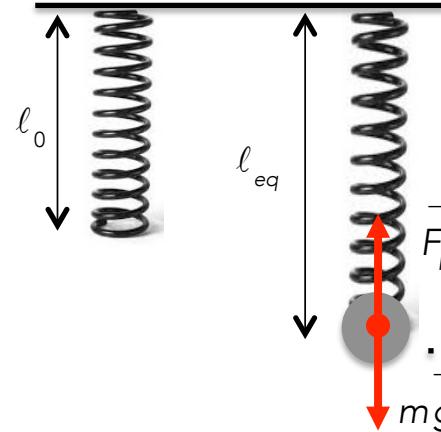

$$\vec{F}_R = -k(\ell - \ell_0) \vec{e}_x = \underbrace{-kx \vec{e}_x}_{>0}$$

## Ressort vertical $x = 0$ : longueur à L'EQUILIBRE

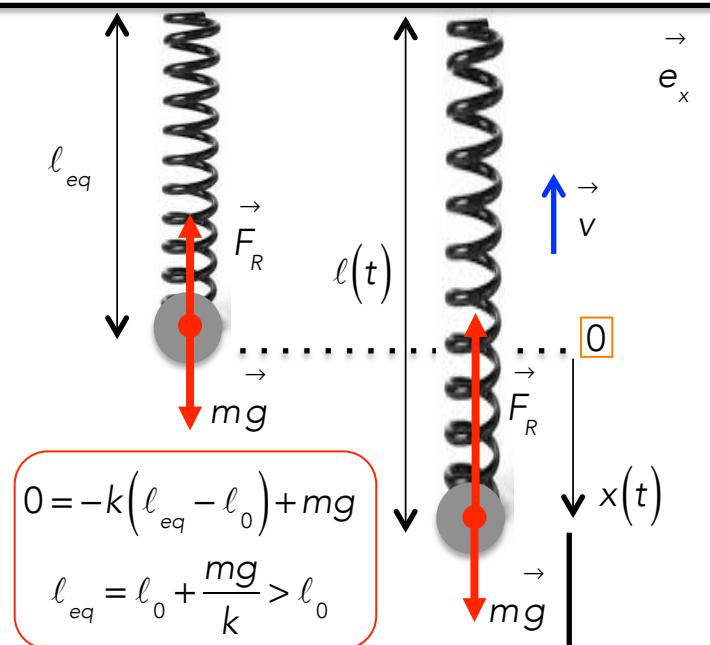

### A vide

### Equilibre

### Dynamique

$$0 = -k(\ell_{eq} - \ell_0) + mg$$

$$\ell_{eq} = \ell_0 + \frac{mg}{k} > \ell_0$$

$x = 0$  à l'équilibre permet de prendre en compte le poids

$$\begin{aligned} \vec{F}_R &= -k(\ell - \ell_0) \vec{e}_x \neq -kx \vec{e}_x \\ \vec{F}_R + mg &= -kx \vec{e}_x \end{aligned}$$

Méthode: loi à TOUJOURS vérifier

- (1)  $\vec{F}_R = 0$  si  $x = 0$
- (2)  $\vec{F}_R$  selon  $-\vec{e}_x$  si  $x > 0$
